

Terrain shape along the direction of travel

Original berm and revised smooth hill | actual quantized heightfield

Original steep berm: center (-8, 0) m, heading 0°; Smooth steep hill: center (0, 0) m, heading 0°

Slope = $\text{atan}(\text{rise} / \text{run})$ over a centered 0.5 m span. Heights use the stored BMP and calibrated orientation; bilinear sampling may differ slightly from Chrono's terrain triangles. No additional curve smoothing is applied.

Geometry is shown only to verify the physical scene. It is not a model input; slope alone does not establish a vehicle stall.
